HACK Splash Pro Ex 1.13.2 Serial (NEW) DeLtA Sn1p3rQ: What is the first camera to take a picture on Mars using a diamond prism? I have read that the first camera on Mars used a diamond prism as its primary focusing element, where the diamond was rotated to allow it to view a wider range of the planet. If this is the case, what was the earliest camera on Mars which used a diamond prism? A: From the 2010 NASA press release: In 1984, the first successful mission to Mars was the Mars Pathfinder. It was in charge of the first ever image from an extraterrestrial body, a photograph taken from a camera aboard the lander as it touched down on the surface of Mars. The image, transmitted to Earth on 5 September, revealed a dusty, rocky landscape. It was taken using a new camera, and was one of the first ever images to transmit back to Earth. There has been steady progress ever since – more cameras, better cameras, greater success and, now, a mounting depth of knowledge on Mars. The current Mars Rover is named Curiosity, has a diamond prism camera and a number of other instruments for on-board science, and landed in 2012. The camera's diamond prism gives the longest wide angle of view among cameras already in existence and has been specifically chosen to image the entire planet as well as possible. From JPL The video has a clip showing the diamond prism on Curiosity: from ! " Oh, no!" " Don't come any closer!" "I swear I'll shoot!" "You may shoot all you want, but the bullet won't stop me." " Come on, Dot!" " Give me my money!" "I've got a special weapon of my own!" "Oh, my." "This seems to be a very dangerous area." "I think we should move on." "I've really got the hots for you." "Come on, baby!" "Show me what
