This invention relates to pumps, and more particularly to helical pumps for manufacturing paper from pulp stock or stock suspension. The invention is particularly applicable to a helical centrifugal pump with some of its features being applicable to other types of non-centrifugal pumps, and the invention is not limited to a helical pump, although such a helical pump is preferred. Generally, the manufacture of pulp stock for paper making is carried out by mixing and flotation of wood chips in pulp mills. There are two basic types of mixtures: xe2x80x9cwetxe2x80x9d (water, wood chips) and xe2x80x9chigh yieldxe2x80x9d pulp (water, wood chips, pulp). The xe2x80x9cwetxe2x80x9d pulp comprises about 90 wt. % water and about 10 wt. % wood chips. The xe2x80x9chigh yieldxe2x80x9d pulp comprises about 25 wt. % water and about 75 wt. % wood chips. Generally, the pulp stock is conveyed in a vertical direction through a system of pipes from the top of the system. A helical pump is one way of conveying pulp stock that is the preferred method. Helical pumps are compact, light, and require lower energy than traditional centrifugal pumps, although less than half the discharge area. Further, a helical pump is less expensive than a traditional centrifugal pump. In a conventional helical pump, the pulp stock flows helically as it is conveyed upwards from a pulp stock source to a discharge. As pulp stock travels from the pulp stock source to the discharge, some of the wood chips and the water are discharged. The action of the helical pump to the pulp stock causes the stock to travel in a circular direction around a vertical axis that is perpendicular to the direction of the stock flow. The walls of the pulp stock discharge pipe are generally smooth and are free of obstructions to allow the pulp to flow smoothly out of the discharge pipe. A conventional helical pump that has a higher efficiency would allow the discharge to have a larger diameter. Problems exist with a conventional helical pump, however, in that the rate of water and pulp stock flowing through the discharge is dictated by the height at which the pump is mounted. Thus, the speed of the pump is limited by the height of the pulp stock.
