EditionsApplications.Q:
Is it a safe to retain the
`allocator_type` type in
a class? I've been
studying some code by
a smart and talented
programmer. It seems

like he wrote some allocator-based class which wraps the basic standard allocator. After I studied the code, I know that using his wrapper allocator, it is able to provide a uniform interface to all users. I can't help myself thinking about the possible security risks that this kind of coding may have.

PADLECK Â· SolidWorks 2011 SP0.0 x32 Full Multilanguage Editions (2010) Depending on the. worked just fine. With it, 3D Interiors works great.Q: C++ - Proper way to declare a const reference? Say I have this declaration, what is the proper way to declare const reference to any type (e.g., vector&)? const vector& v = getValue(); And in general - what is the correct way to declare a const reference to any type? const vector& v =

getValue(); const vector& w = getValue(); For the purposes of my compiler only, the above declarations are identical and work as expected, but I don't know if a newer version of the standard will change the behavior. A: It's a common mistake, but: "reference to const" only means "constant address". If you want to make a variable constant, you have to make it an r-value. That is, there's no value you can assign to it so it can't be assigned to another variable or be passed around. This is easy to think of with an int, which is just an object of a type. The object exists and has a pointer to it, and your int can be modified but it just doesn't exist outside the object. In your case, if you make v a pointer, it will likely remain constant and the fact that the vector itself is constant doesn't help you: const vector* v = &getValue(); Now v will be constant but the container is not; you don't want to permanently give v a reference to the container. If you want it to be constant, you have to make it an r-value. const vector v = &getValue(); This is true of all types, except things that are constant by default. That is, you can set to a constant object with a pointer or reference, and both will do the right thing. But you can't declare a constant reference, so make it an r-value. const string* s = new string(); // or string* s; s = new string(); Again, it's easy to think that the first one will remain constant while the second one is an r-value. It's not
