About The Game In ancient times, upon the convergence of the celestial and terrestrial forces, an explosion occurred that shattered the heavens. When the dust settled, over half of the world's population

had perished. Over two thousand years later, all that remained of the civilization that was, was an island. Its location, for centuries unknown. The island was rumored to be in the Northeast Pacific, roughly seven hundred miles north of San Diego.

About Me The beloved prince of Gamblon laid to rest on Saturday the 30th of May a year ago, after succumbing to a long battle with cancer. Well, if there's any site devoted to his (brief) life and works, this site is the only one I know of. Like most of you, I got into gaming as a kid, playing pirated games on my parents' computer. From him came Commodore 64, Amstrad GX600, and later the PCs (Microsoft, of course!). From her, the Amiga 500, and then the PS1 and Gameboy. At some point I also built my own FM8 kit and

started playing games on that, way back in the 8-bit days. I started playing some of the biggest franchises back then, like Uncharted, Metal Gear and Zelda, and I could never walk away from these games. In 2005 I started playing games on my own using an Xbox 360, an PS2 and the PC, reaching through each of them in search of that special game that managed to touch my heart and fuel my drive to make my own games someday, one way or another. So here I am, a no-name indie developer making fan games at home in one

corner of Europe. I hope to make
enough to pay the bills and not let
my kids be financially supported by
my games. Let's see what the

Host-Island Dynamics in the Atlantic Strongylocentrotus franciscanus Dueck, 1969 (Copepoda: Cyclopidae) and its Relationship to Its Natural Abundance. Coral reef fish are often considered indicator organisms for coral-reef-based ecosystems due to the fish's behavioral, ecological, and physiological association with corals. *S. franciscanus*, considered one of the most important herbivorous fish species in a coral reef ecosystem because of its essential role in maintaining the structure and the primary productivity of the reef, and its susceptibility to disease, is targeted by coral-reef management programs because it provides some of the most abundant prey for reef predators. The disturbance rates experienced by the herbivore-fish, *S. franciscanus*, may affect that species, or other species in the reef community, behaviorally or through its effects on coral resources. This study aims to examine the site-specific effects of the algal turf and associated fish upon the herbivorous *S. franciscanus* on a Caribbean reef, where it may

play an important role in coral reef ecosystems and may be threatened by anthropogenic stressors. We used visual census surveys, mark and recapture and a random intercept trap to investigate the refuge usage of *S. franciscanus* on Lighthouse Reef and N.E. Cay, *S. franciscanus*'s preferred habitat at these sites. Habitat use was habitat-specific, with *S. franciscanus* tend to be more abundant in the more productive turf-reef habitat at Lighthouse Reef as compared to N.E. Cay. We also observed symbiotic fishes of the order Labridae and Serranidae in close proximity of the herbivorous-fish as possible host-island specialists. Our study showed that *S. franciscanus* can regulate its abundance through habitat preference and selective foraging, but habitat preference is site-dependent. Our findings further indicated that *S. franciscanus* receives a consistent supply of food due to the presence of symbiotic fishes that attract the herbivore-fish to their preferred habitat. In a healthy coral reef ecosystem, this herbivorous-fish should be able to adapt to change through increased or decreased predation risk and habitat preference. *S.*

**franciscanus is not currently being targeted by coral reef management programs, but management focus should include in-depth investigations into the trophic and taxonomic interactions that maintain the health of this important species as part of the reef.Q:
