Professional that is compatible with. Detailed Statistical Characterization of Energy Substantial Out-of-Time (OOT) Events in Ultrafast Electron Pumping. Ultrafast electron pumping is a widely applicable experimental technique that provides access to an important class of electronic states of matter inaccessible by traditional laser-based methods. Pumping typically takes place in small optical cavities that are spatially confined, and the resulting optical fields in the sample can excite coherent transitions to highly excited states. Pump-probe experiments allow for ultrafast electron pump fields to be timed to the arrival of the pump-probe pulse pairs, thus spatially mapping pump-probe asymmetries on a population timescale. We use the pump-probe technique to measure the excited state population of the singlet excited state of pentacene and present detailed statistical characterizations of the energy of out-of-

time (OOT) excitations in the pump-probe signal. We find that this particular excited state, which in its singlet form has a signature dithiatropic charge transfer transition, has an unusually low OOT energy compared to previous measurements of other pentacene excited states.Q: 6d1f23a050
