I have recently learned that Linux use permission bits for the file system, while FAT32 use permissions for files. I have this simple doubt, when I change the permission bits of a file, in which mode of operation is carried out? chmod changes permission bits, but does it change the permission bits of a file on the file system or only within the file? A: The permissions on a file are stored in the file itself, not the directory structure. Chmod changes the permissions on the file. Ethnic Malaysian men's aspirations and needs for genital cleansing practices: a grounded theory approach. The aim of this research was to understand Malaysian men's perceptions and attitudes towards genital cleansing as a means of protecting against a sexually transmitted infection (STI). Utilizing a grounded theory approach, data was obtained from 14 focus groups with male participants. Analysis was undertaken using a thorough process of coding, constant comparison, memo writing and developing a conceptual framework.

Study results show that ethnic Malay men consider genital cleansing as a must do (n=20), performing it as an important part of the STI prevention strategy (n=21) and important for emotional and social reasons (n=14). This is particularly so if they have had unprotected sex (n=11).

Translated into a conceptual framework, ethnic Malaysian men consider the genital cleansing as a vital means of STI prevention as it is culturally acceptable and a significant means of showing respect and trust to one's partner. Crystal structure of hexahistidine-tagged Escherichia coli uroporphyrinogen III synthase at 2.9 Å resolution. Uroporphyrinogen III synthase, from Escherichia coli, is a porphyrinogenic enzyme that catalyzes condensation of two molecules of glutamic acid to form uroporphyrinogen III. We report here the structure of hexahistidine-tagged human uroporphyrinogen III synthase. A comparison of this structure with the previously published structure of the uroporphyrinogen III synthase from Bacillus subtilis reveals an overall r.m.s. deviation
