Praktisch Uml Warmer Pdf Download

siberia can normally expect to have a series of low and high pressure systems moving over the region allowing warmer and cooler air to affect the weather. however, a strong jet stream in the 2019-2020 winter led to very warm conditions which caused ice and snow to melt and in turn increased the warming with darker surfaces absorbing more heat. overall, the 6 months from january to june 2020 were more than 5 degrees celsius warmer than average (19812010) over the study region (see figure 1). this extremely hot period led to local heat records being broken, including at the verkhoysk weather station which recorded 38 degrees celsius on 20 june. the russian meteorological service said that this measured temperature was the highest ever recorded beyond the arctic circle, with the world meteorological organization carrying out its own research to verify this. a recent study we conducted in the eastern arctic ocean and adjacent coastal waters of russia in 2018 showed that sea ice extent and mixed layer temperatures in the coastal region are decreasing and that these changes are most likely related to the loss of sea ice. we found that older and thicker sea ice persisted in this coastal region and may be used as a long-term indicator of coastal water temperatures. the loss of older sea ice has been projected for other coastal regions of the arctic ocean [20]. our observations indicate that the warm coastal water may have played an important role in accelerating sea ice decline in the coastal region in the years since 2014. thus, the warm coastal water and warmer than average surface temperatures in this region have the potential to accelerate the retreat of older ice and hence amplify the sea ice decline in the subsequent years [39]. 5ec8ef588b
