The activation code SHALL NOT be stored on the subscriber's device and SHALL NOT be displayed to the subscriber. The activation code SHALL be stored on the CSP and SHALL be displayed to the subscriber. To verify that the PIN selected for verification matches the one used for registration, verifiers SHALL check that the memory of the verifier contains at least one character. Bytes of decoded data SHOULD be checked one-by-one in the order they were received from the publisher.

Missing verification credentials SHOULD be ignored and should not prevent the call from completing successfully. Publishers SHALL support the following Message Authentication Codes (MACs) for data returned in the TCP/IP connect and verify messages: HMAC-MD5, HMAC-SHA1, HMAC-SHA256, and HMAC-SHA512. The default for publishers is HMAC-SHA256. Verifiers SHALL validate any message MACs received from a publisher. If the specified MAC algorithm in the

message is not supported by a publisher, then the publisher SHALL return a message indicating that the specified MAC algorithm is not supported. for each memorized secret, the subscriber may provide a secret code that is used to encrypt the secret before storing it in the same manner as the secret. the secret code shall be a memorized secret, and it may be at least 8 characters in length. each secret code shall be assigned a random value known only to the subscriber, and must be at least 8 characters in length. the specific method for choosing the random value is out of scope for this specification. the secret code may be stored in a secure manner. the secret code may be written down or stored in a file on a computer system. the secret code may be stored on the same computer system that is used to perform verification.

If the authenticator reports a loss of its activation secret, the authenticator **MUST** notify the subscriber by using a commercially available email service. The service **SHALL** allow the subscriber to specify the method of delivery, including a method of receiving notification via email. The authenticator **SHALL** encrypt, record or otherwise maintain the secret in a format that prevents the secret from being analyzed in a side-channel attack that would allow an attacker to infer the secret through monitoring the execution of the cryptographic function. This **SHOULD** be the same secret function used to generate the authenticator activation secret, as the secret should be stored in the same binary format used to generate the activation secret. Best described as a modern adventure game, the visual style of Layers of Fear certainly bears a striking resemblance to The Chamber by The Chamber developer Greg Zeschuk (alliteration intended). While the game looks like a 3D platformer, it rather behaves like a horror game. A pair of high contrast, back-lit boxes with glowing eyes make for the most prominent and unnerving set pieces,

and in the process, you're faced with many a tense decision. Most of the time, you are presented with your decisions in tense, cold, minimalist lettering.

Think back to the Snow White mirror test described earlier. Because Layers of Fear is not an adventure game, it lacks the ease of that genre.

The game gives you no way to save your progress, so you should plan to retry levels as often as your short attention span will allow. Some are better than others, so you may want to retry those, as well. Too much about the game is dictated by chance and timing. This makes it particularly challenging, but it may keep you coming back for more. 5ec8ef588b
